

File Structure of Ionic Blank Project (Ionic + Angular)

When we create a blank Ionic project using the command **ionic start myApp blank --type=angular**, Ionic automatically generates a well-organized directory structure. This structure helps developers build scalable and maintainable cross-platform applications.

Root Directory Structure

The root directory contains configuration files and main folders such as `node_modules`, `src`, `e2e`, and various JSON configuration files used by Ionic and Angular.

`node_modules/`

This folder contains all third-party libraries and dependencies required for the project. It is created automatically when `npm install` is executed and should not be edited manually.

`e2e/`

The `e2e` folder is used for end-to-end testing. It contains automated tests that simulate real user interaction with the application.

`src/ Folder`

The `src` folder contains the complete source code of the Ionic application. It includes application logic, UI components, assets, and theme files.

`src/app/`

The `app` folder is the core of the Ionic application. It contains all pages, components, modules, and routing files. The `home` folder inside `app` represents the default page.

Home Page Files

`home.page.html` defines the user interface, `home.page.scss` contains page-specific styles, `home.page.ts` handles business logic, `home-routing.module.ts` manages routing, and `home.module.ts` defines the Angular module for the page.

`assets/`

The `assets` folder stores static files such as images, icons, and fonts used in the application.

`environments/`

This folder contains environment-specific configuration files such as `environment.ts` for development and `environment.prod.ts` for production.

`theme/`

The `theme` folder contains global styling variables. The `variables.scss` file is used to customize colors, fonts, and overall appearance of the app.

Other Important Files

index.html is the main HTML entry file, main.ts is the application entry point, global.scss defines global styles, and polyfills.ts ensures browser compatibility.

Conclusion

The Ionic blank project follows a modular and component-based architecture. This structured file organization improves maintainability, scalability, and supports efficient cross-platform application development.
